

Step by Step: Working with CRM plugin profiler

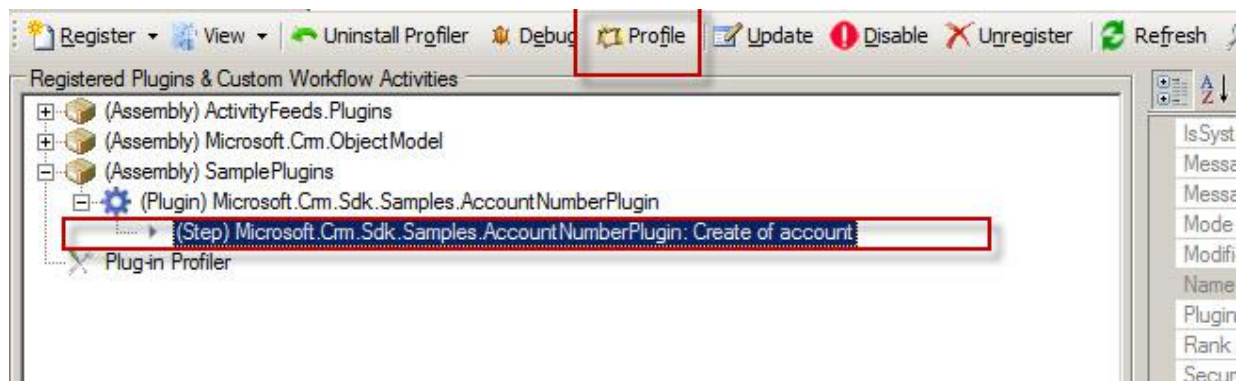

1. From the plugin registration tool, click the **Install Profiler**.

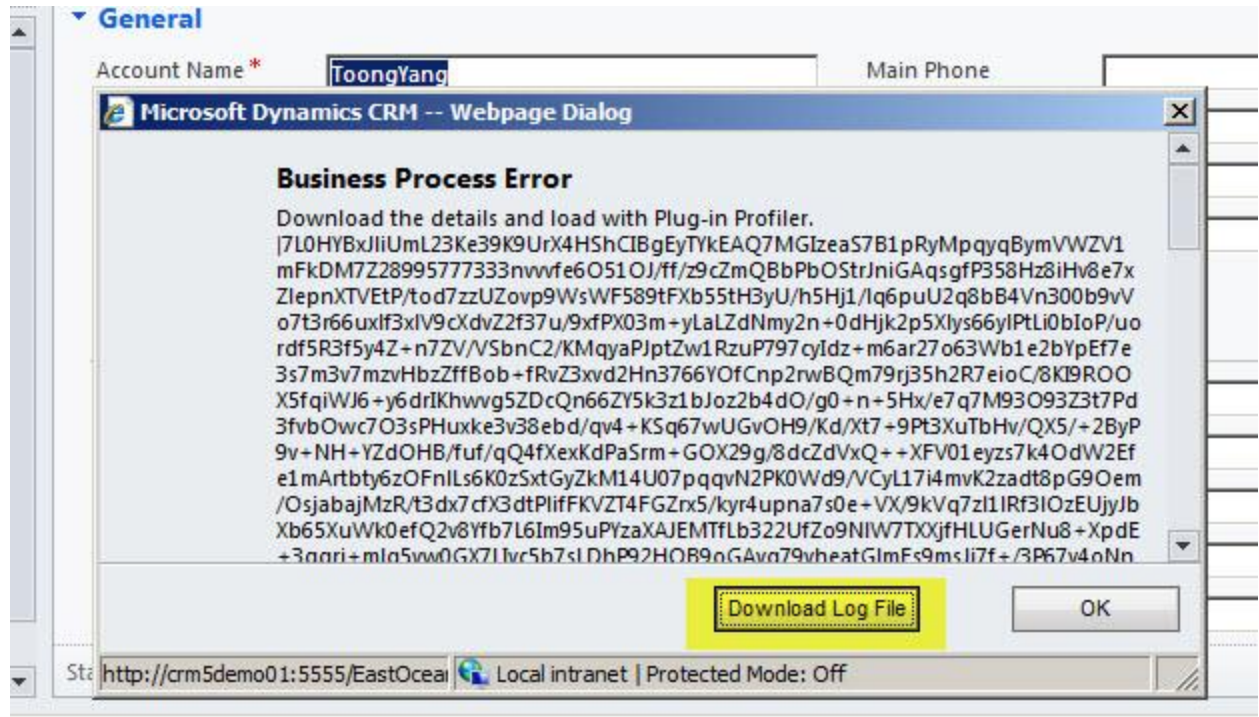

2. Once it finished, make sure **Plugin Profiler** exists.

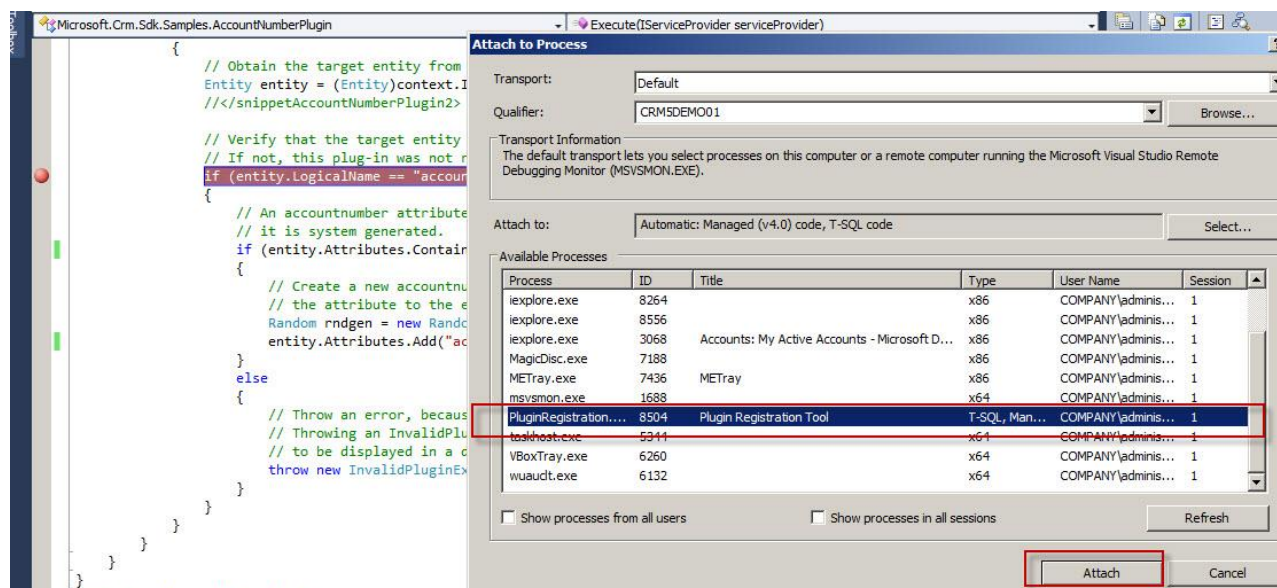

3. Select the plugin step needed to debug, click **Profiler** to enable profiling.

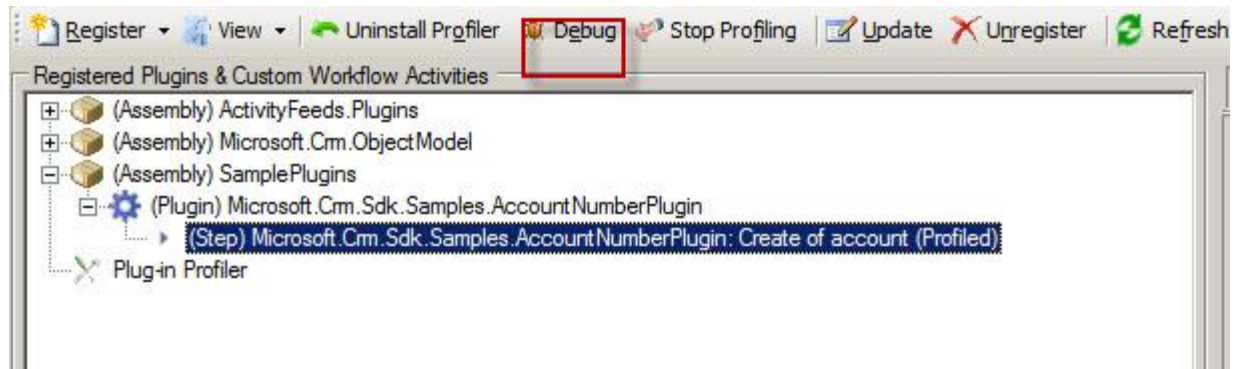

4. Navigate to CRM system, perform the account creation which will trigger the plugin to be execute. Download the error log file and save in desktop.

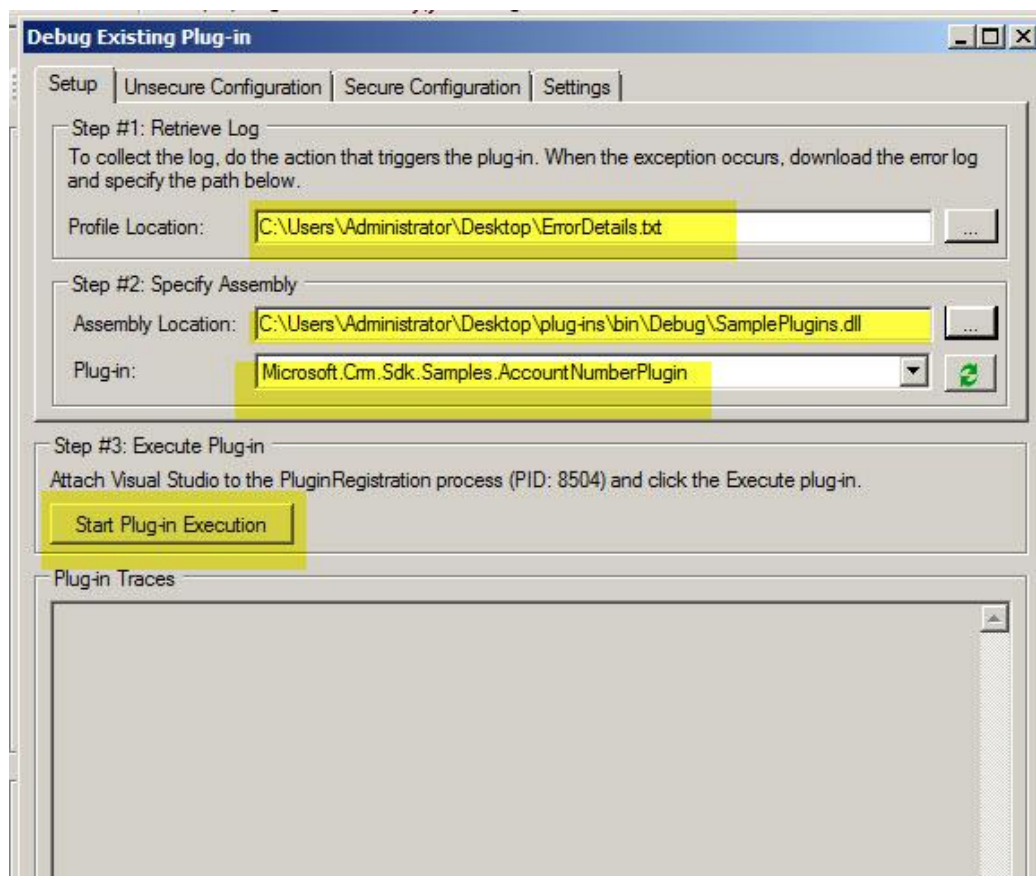

5. Run the visual studio solution, attach debug process named "PluginRegistration". Set a break point in the code.

6. Open the plugin registration tool, click the **Debug** button.

7. Browse the profile location with the erro log we downloaded in item 4. Choose the assembly location and click start plugin execution.

8. System will auto step into visual studio breakpoint line.
